

MySQL - RDBMS

Trainer: Mr. Rohan Paramane

MySQL Programming

- RDBMS Programming is an ISO standard part of SQL standard since 1992.
- SQL/PSM stands for Persistent Stored Module.
- Inspired from PL/SQL Programming language of Oracle.
- PSM allows writing programs for RDBMS. The program contains set of SQL statements along with programming constructs e.g. variables, if-else, loops, case, ...
- PSM is a block language. Blocks can be nested into another block.
- MySQL program can be a stored procedure, function or trigger.

MySQL Programming

- MySQL PSM program is written by db user (programmers).
- It is submitted from client, server check syntax & store them into db in compiled form.
- The program can be executed by db user when needed.
- Since programs are stored on server in compiled form, their execution is very fast.
- All these programs will run in server memory.

Stored Procedure

- Stored Procedure is a routine. It contains multiple SQL statements along with programming constructs.
- Procedure doesn't return any value (like void fns in C).
- Procedures can take zero or more parameters.
- Procedures are created using CREATE PROCEDURE and deleted using DROP PROCEDURE.
- Procedures are invoked/called using CALL statement.
- Result of stored procedure can be
 - returned via OUT parameter.
 - inserted into another table.
 - produced using SELECT statement (at end of SP).
- Delimiter should be set before writing procedure.

Stored Procedure

```
-- 01_hello.sql (using editor)
CREATE TABLE result(v1 DOUBLE, v2 VARCHAR(50));
                                                       DROP PROCEDURE IF EXISTS sp_hello;
DELIMITER $$
                                                       DELIMITER $$
                                                       CREATE PROCEDURE sp_hello()
CREATE PROCEDURE sp_hello()
                                                       BEGIN
BEGIN
                                                          SELECT 1 AS v1, 'Hello World' AS v2;
  INSERT INTO result VALUES(1, 'Hello World');
                                                      END;
                                                      $$
END;
$$
                                                       DELIMITER;
DELIMITER;
                                                      SOURCE /path/to/01_hello.sql
CALL sp_hello();
                                                      CALL sp_hello();
SELECT * FROM result;
```

Stored Procedure – PSM Syntax

VARIABLES DECLARE varname DATATYPE; DECLARE varname DATATYPE DEFAULT init_value; SET varname = new_value; SELECT new value INTO varname;

SELECT expr or col INTO varname FROM table name;

```
PARAMETERS
CREATE PROCEDURE sp_name(PARAMTYPE p1 DATATYPE)
BEGIN
END;
-- IN param: Initialized by calling program.
-- OUT param: Initialized by called procedure.
-- INOUT param: Initialized by calling program and
modified by called procedure
-- OUT & INOUT param declared as session variables.
CREATE PROCEDURE sp_name(OUT p1 INT)
BEGIN
    SELECT 1 INTO p1;
END;
SET @res = 0;
CALL sp name(@res);
SELECT @res;
```

```
IF-ELSE
IF condition THEN
    body;
END IF;
IF condition THEN
     if-body;
ELSE
     else-body;
END IF;
IF condition THEN
     if1-body;
ELSE
    IF condition THEN
            if2-body;
     ELSE
            else2-body;
     END IF;
END IF;
IF condition THEN
    if1-body;
ELSEIF condition THEN
    if2-body;
ELSE
     else-body;
END IF;
```

```
SHOW PROCEDURE STATUS
LIKE 'sp_name';

SHOW CREATE PROCEDURE sp_name;

DROP PROCEDURE
DROP PROCEDURE
IF EXISTS sp_name;
```

SHOW PROCEDURE

CASE-WHEN

```
CASE
WHEN condition THEN
body;
WHEN condition THEN
body;
ELSE
body;
END CASE;
```

MySQL Triggers

- Triggers are supported by all standard RDBMS like Oracle, MySQL, etc.
- Triggers are not supported by WEAK RDBMS like MS--Access.
- Triggers are not called by client's directly, so they don't have args & return value.
- Trigger execution is caused by DML operations on database.
 - BEFORE/AFTER INSERT, BEFORE/AFTER UPDATE, BEFORE/AFTER DELETE.
- Like SP/FN, Triggers may contain SQL statements with programming constructs. They may also call other SP or FN.
- However COMMIT/ROLLBACK is not allowed in triggers.
 They are executed in same transaction in which DML query is executed.

CREATE TRIGGER

CREATE TRIGGER trig_name
AFTER|BEFORE dml_op ON table
FOR EACH ROW
BEGIN

body;

- -- use OLD & NEW keywords
- -- to access old/new rows.
- -- INSERT triggers NEW rows.
- -- DELETE triggers OLD rows.

END;

SHOW TRIGGERS

SHOW TRIGGERS FROM db name;

DROP TRIGGER

DROP TRIGGER trig name;

Thank you!
